ETERNITY: NUMBERS
User Stories, Traceability Matrix and
Implementation of the User Stories

Acknowledgment

I would like to express my sincere gratitude to our professor **Pankaj Kamthan** for his cooperation, suggestion, guidance, and continuous encouragement through the course of the study. I am highly grateful to our teaching assistance **M. Ishanian** for reviewing this report and giving us suggestions to improve it.

Abstract

In this document, the user stories for calculator system has been described. Each user story is associated with a priority, estimate (in story points), as well as with one or more acceptance tests. The document also describes backward traceability matrix for each user story. In the last, it also provides information on the Java implementations of the selected representative user stories.

Contents

Chapter 1

Background

1.1 Introduction

This document is a part of project report on the problem domain model Calculator System. Domain is a calculator that computes the value of certain established irrational numbers. The purpose of the project is to carry out a number of activities, resulting in a set of inter-related artifacts for the problem domain of such a calculator.

In this document, the user stories for calculator system has been described. Each user story is associated with a priority, estimate (in story points), as well as with one or more acceptance tests. The document also describes backward traceability matrix for each user story. In the last, it also provides information on the Java implementations of the selected representative user stories.

Chapter 2

User stories for calculator system

2.1 Acknowledgement and Conventions

1. **User story statement:** Following structure is used to build up user story statement:

   As a **[Role]**, I want to ... **[Goal]**, so that I can ... **[Value]**.

2. **Priority:** The prioritization of user stories is done using MoSCoW prioritization scheme. Each user story is assign a category of MoSCoW considering:

   - The importance to stakeholders
   - The frequency of use
   - The order of use

3. **Estimated Story Points:** The story points of user stories are expressed in a pseudo-Fibonacci Sequence (0, 1/2, 1, 2, 3, 5, 8, 13, ... Infinity).

4. **Sizing:** Sizing is done using the **hour based estimation** and considering:

   - The amount of work to do
   - The complexity of the work
   - The time need to implement

2.2 User stories for calculator system

User Story 1	
Id	US1
User Story Statement	As a mathematician, I want to calculate the value of the silver ratio number up to given certain decimal places, so that I can see what the number is up to certain decimal places.
Acceptance Criteria	Given that I need to calculate the value of silver ratio number having 10 digits after the decimal point, When I perform an operation by providing 10 as a number of digits I want after the decimal point, I should see 2.4142135623 as an answer.
Priority	Must have
Constraint-1	The decimal expansion of an calculated irrational number **should never repeat**.
Constraint-2	All the numbers after decimal point in the calculated value of the silver ratio number **must be correct in a manner that the correct value of silver ratio up to 15 decimal places is 2.414213562373095**.
Estimated Story Points	5

User Story 2	
Id	US2
User Story Statement	As a mathematician, I want to calculate an area of a regular octagon with given side length, so that I can see what the area is for a given side length.
Acceptance Criteria	Given that I need to calculate an area of a regular octagon with a side length of 8, When I perform an operation by providing 8 as a side length of an octagon, Then I should see 309.02 as an answer.
Priority	Must have
Constraint	The expression to calculate an area of a regular octagon should use the number 2.4142135623 as a value of the silver ratio number, which has **exactly 10 digits after the decimal point**.
Estimated Story Points	3

</table>

User Story 5	
Id	US4
User Story Statement	As a mathematician, I want to evaluate an irrational arithmetic expression, so that I can see what the evaluated result is.
Acceptance Criteria-1	Given that I have $(\delta s + 4)/100 * 3$ as an irrational arithmetic expression, When I evaluate the expression, Then I should see the result as 0.1924264068.
Acceptance Criteria-2	Given that I have two numbers 5 and the silver ratio number δs, When I perform addition on them, Then I should see the sum as 7.4142135623.
Acceptance Criteria-3	Given that I have two numbers 2 and the silver ratio number δs, When I subtract 2 from the silver ratio number δs, Then I should see the difference as 0.4142135623.
Acceptance Criteria-4	Given that I have two numbers 5 and the silver ratio number δs, When I multiply 5 with the silver ratio number δs, Then I should see the product as 12.0710678115.
Acceptance Criteria-5	Given that I have two numbers 0 and the silver ratio number δs, When I multiply 0 with the silver ratio number δs, Then I should see the product as 0.
Acceptance Criteria-6	Given that I have two numbers 1 and the silver ratio number δs, When I multiply 1 with the silver ratio number δs, Then I should see the product as 2.4142135623 which is the same as the silver ratio number δs.
Acceptance Criteria-7	Given that I have two numbers 10 and the silver ratio number δs, When I divide 10 by the silver ratio number δs, Then I should see the quotient as 4.14213562386.
Acceptance Criteria-8	Given that I have two numbers 0 and the silver ratio number δs, When I divide 0 by the silver ratio number δs, Then I should see the quotient as 0.
Acceptance Criteria-9	Given that I have two numbers the silver ratio number δs and 0, When I divide the silver ratio number δs by 0, Then I should see the quotient as infinity.
Priority	Must have
Constraint	**If an irrational arithmetic expression has the silver ratio as an operand**, it should use the number 2.4142135623 as a value of the silver ratio number, which has **exactly 10 digits after the decimal point**.
Estimated Story Points	5

User Story 6	
Id	US6
User Story Statement	As a mathematician, I want to verify that ratio between given two numbers is the silver ratio or not, so that I can confirm that both the given numbers are consecutive numbers from the Pell number sequence or not.
Acceptance Criteria-1	Given that I have two numbers $n1 = 29$ and $n2 = 12$, When I evaluate using both the numbers $n1$ and $n2$, Then I should see the resulting message as "Pell Numbers".
Acceptance Criteria-2	Given that I have two numbers $n1 = 45$ and $n2 = 5$, When I evaluate using both the numbers $n1$ and $n2$, Then I should see the resulting message as "Not Pell Numbers".
Priority	Could have
Constraint	Let's say $n1$ and $n2$ are given two numbers where $n1 > n2$. The ratio $n1/n2$ of both the numbers is silver ratio if it equals to the ratio of the sum of the smaller number $n1$ and twice the larger number $n2$ to the larger number $n2$. So, $n1/n2$ is the silver ratio if: $$\frac{n1}{n2} = \frac{2n1 + n2}{n1}$$

Chapter 5

Conclusion and Discussion

5.1 Conclusions

I learn lot of things such as Brainstorming and Mind Mapping, Domain Modeling, Use case modeling. I believe this will help me in future towards my carrier.

5.2 Future Directions

Creation of user stories from the user cases, implementation of those user stories using Java programming language.
